CLOUD SECURITY

Cloud Security Assessment

Multi-cloud assessment across AWS, Azure, GCP, and M365 — beyond CIS benchmarks to real exploitation paths.

KEY BENEFITS

Why This Matters

Real Exploitation, Not Just Compliance

We test actual IAM privilege escalation chains and cross-account pivots — not just CIS checkboxes.

Multi-Cloud in One Engagement

AWS, Azure, GCP, and hybrid environments assessed comprehensively together.

M365 Deep Dive

Exchange, SharePoint, Teams, Entra ID, Conditional Access — areas most vendors skip.

YOUR CHALLENGE

Your cloud spans multiple providers, M365 tenants, and hybrid environments:

- IAM policy complexity with hidden privilege escalation paths
- Cross-account trust relationships enabling lateral movement
- M365/Entra ID misconfigurations exposing sensitive data
- CIS benchmark gaps across multiple providers

Why Technieum as Your Trusted Partner

Technieum brings 6 proprietary AI platforms, an in-house R&D team actively hunting zero-days, and AI-powered methodologies that deliver validated, exploitable findings with guaranteed zero false positives — enabling your team to focus remediation effort where it matters most.

OUR SOLUTION

Services Overview

Technieum combines configuration review, CIS benchmarking, and real penetration testing — proving what's actually exploitable.

1	**Cloud Security Reviews**	Comprehensive assessment of AWS, Azure, and GCP environments covering IAM policy chain analysis, network security group configurations, storage bucket permissions and encryption, logging and monitoring setup, secrets management, service-specific security controls, and cross-account trust relationship evaluation with exploitability validation.
2	**Office 365 Security Review**	Exchange, SharePoint, Teams, Entra ID, Conditional Access, MFA, Defender settings.
3	**Cloud Infrastructure Testing**	IAM privilege escalation, cross-account pivoting, metadata attacks, container escapes.
4	**CIS Benchmark Review**	Systematic evaluation against CIS for AWS, Azure, GCP, K8s, M365.
5	**IAM & Privilege Escalation**	Role chaining, policy boundaries, cross-service permissions, assume-role trust exploitation.
6	**Kubernetes Security**	RBAC, network policies, pod security, secrets management, container image security.

THE TECHNIEUM EDGE

Why Technieum for Cloud Security

Our Methodology
CIS benchmark assessment → real exploitation testing (IAM chains, cross-account pivots, metadata attacks) → compliance framework mapping.

Beyond CIS Checks
Real IAM chain testing, cross-account pivots, data exfiltration paths.

Multi-Cloud Expertise
AWS, Azure, GCP, and hybrid assessed in a single engagement.

M365 Security
Exchange, SharePoint, Teams, Entra ID — deep assessment.

ToIP Cloud Intel
RAG-powered playbooks with cloud-specific exploit techniques.

Provider-Specific Remediation
Terraform, ARM, CloudFormation fix templates.

Zero False Positives
Every misconfiguration validated for real exploitability.

Standards Alignment

Every Technieum engagement aligns with globally recognized security frameworks including OWASP Top 10, OWASP API Top 10, OWASP LLM Top 10, PTES, NIST CSF, NIST AI RMF, MITRE ATT&CK, CIS Benchmarks, IEC 62443, and ISO 27001:2022. Our team holds OSCP, OSEP, CRTE, CRTP, eWPTX, eCPPT, and CEH certifications. Technieum is ISO 9001:2015 and ISO 27001:2022 certified.

OUR METHODOLOGY

How We Deliver Results

Technieum's cloud security methodology follows a structured five-phase approach designed for AWS, Azure, GCP, and Microsoft 365 environments — moving beyond CIS benchmarks to real exploitation testing.

Discover	Analyze	Attack	Report	Remediate
Asset enumeration	ToIP intelligence	Manual exploitation	CVSS/CWE scoring	AI-powered fixes
Tech fingerprinting	Logic extraction	Business logic test	PoC evidence	Stack-specific code
OSINT gathering	Threat modelling	Chain validation	Exec summary	Config guidance
Scope validation	Risk prioritization	Privilege escalation	Test case docs	Retest validation
Port scanning	Attack planning	Lateral movement	Playbook docs	Closure sign-off
Service detection	Playbook generation	Data exfiltration	Risk heatmap	Knowledge transfer

Phase 1 — Discover

Cloud environment enumeration across AWS, Azure, and GCP — mapping IAM roles, policies, trust relationships, network security groups, storage buckets, serverless functions, container registries, and M365 tenant configurations.

Phase 2 — Analyze

CIS Benchmark assessment against provider-specific baselines. IAM policy chain analysis for privilege escalation paths. Cross-account trust relationship mapping. ToIP generates cloud-specific attack playbooks for identified technologies.

Phase 3 — Attack

IAM privilege escalation chain exploitation, cross-account pivoting, metadata service attacks (IMDS), storage bucket misconfiguration exploitation, container escape testing, and M365 Conditional Access policy bypass attempts.

Phase 4 — Report

Cloud-specific technical reports with IAM policy analysis, CIS compliance scorecards, privilege escalation path visualizations, and provider-specific CVSS scoring. Management reports map findings to compliance frameworks (SOC 2, ISO 27017).

Phase 5 — Remediate

Provider-specific remediation — Terraform modules, CloudFormation templates, ARM templates, and Azure CLI commands. IAM policy rewrites, network security group rules, and M365 Conditional Access policy configurations. Retest confirms closure.

DELIVERABLES

What You Receive

Every engagement produces four comprehensive deliverables designed for different stakeholders — from technical teams requiring reproduction steps to executives needing business impact context.

Technical Report	Management Report	Threat Model Report	ToIP Playbook
CVSS-scored, CWE-mapped findings with proof-of-concept evidence and step-by-step reproduction instructions for every vulnerability discovered.	Executive-level risk summary with business impact analysis, prioritized recommendations, and strategic remediation roadmap for leadership.	Comprehensive threat landscape analysis with attack vectors mapped to MITRE ATT&CK framework specific to your environment.	Target-specific attack playbooks generated from 15,000+ real-world disclosed vulnerabilities via our RAG-powered intelligence engine.

- ✓ **Technical Report**
  Detailed findings with CVSS scoring, CWE mapping, proof-of-concept evidence, and step-by-step reproduction instructions.
- ✓ **Management Report**
  Executive-level risk summary with business impact analysis, prioritized recommendations, and strategic remediation roadmap.
- ✓ **Threat Model Report**
  Comprehensive threat landscape analysis specific to your environment, attack vectors, and adversary profiles mapped to MITRE ATT&CK.
- ✓ **ToIP Playbook Document**
  Target-specific attack playbooks generated from 15,000+ real-world disclosed vulnerabilities via our RAG-powered intelligence engine.

All deliverables are produced within the agreed timeline with milestone-driven tracking. Critical findings are escalated immediately via the OffSec Management Portal — you never wait for the final report to learn about urgent risks.

Ready to Secure Your Organization?

Partner with Technieum for AI-powered offensive security with zero false positives.
