WFH SECURITY

Work From Home Security Assessment

Comprehensive assessment of remote work security controls — VDI, DLP, endpoint security, VPN, and collaboration tools.

KEY BENEFITS

Why This Matters

Complete Remote Work Coverage

VDI isolation, endpoint hardening, DLP controls, VPN configuration, identity security, and collaboration tool assessment — all in one engagement.

Real-World Attack Simulation

We simulate how attackers exploit work-from-home environments — personal device compromise, VPN bypass, data exfiltration through cloud storage and collaboration tools.

Zero False Positives

Every finding is manually validated for exploitability in your specific remote work environment. You remediate real risk, not theoretical concerns.

YOUR CHALLENGE

Your workforce operates from home networks, personal devices, and shared environments — creating security risks that traditional office-centric assessments miss entirely:

- VDI environments with potential session hijacking, clipboard exfiltration, and screen capture risks
- Unmanaged personal devices connecting to corporate resources without adequate endpoint controls
- Data loss through cloud storage, personal email, USB devices, and unauthorized file transfer
- VPN misconfigurations enabling split tunneling, DNS leakage, and network-level attacks
- MFA fatigue and session management weaknesses in remote authentication flows
- Collaboration tool misconfigurations exposing sensitive data through Teams, Slack, and Zoom
- Home network vulnerabilities — default router credentials, unpatched firmware, shared Wi-Fi

WORK FROM HOME SECURITY

Remote Work Attack Surface

Comprehensive assessment of every remote work security control

VDI Security

- Session hijacking
- Clipboard exfiltration
- Screen capture prevention
- Print/USB redirection
- Watermarking effectiveness
- Thin client hardening

Endpoint Security

- Unpatched devices
- Personal device risk
- EDR coverage gaps
- Peripheral controls
- Disk encryption
- Local admin restrictions

Data Loss Prevention

- File transfer controls
- Cloud storage leakage
- Email DLP policies
- Screenshot blocking
- Data classification
- USB device blocking

Network Security

- VPN misconfiguration
- Split tunneling risks
- DNS leak testing
- Home router vulns
- Always-on enforcement
- Wi-Fi security audit

Identity Security

- MFA enforcement
- SSO bypass testing
- Session management
- Conditional access
- Privilege escalation
- Token security

Collaboration Tools

- Teams/Slack data leak
- Screen sharing risks
- Guest access abuse
- External file sharing
- Meeting security
- Channel permissions

Why Technieum as Your Trusted Partner

Technieum brings 6 proprietary AI platforms, an in-house R&D team actively hunting zero-days, and AI-powered methodologies that deliver validated, exploitable findings with guaranteed zero false positives — enabling your team to focus remediation effort where it matters most.

OUR SOLUTION

Services Overview

Technieum's Work From Home Security Assessment evaluates every layer of your remote work infrastructure — from VDI isolation and endpoint security to DLP controls, VPN configurations, identity management, and collaboration tool hardening.

1	**VDI Security Assessment**	Comprehensive evaluation of virtual desktop infrastructure isolation — session hijacking attempts, clipboard data exfiltration between host and guest, screen capture prevention effectiveness, USB and peripheral redirection policies, print control bypass testing, digital watermarking validation, and thin client hardening assessment. Covers Citrix Virtual Apps and Desktops, VMware Horizon, and Azure Virtual Desktop (AVD) environments.
2	**Remote Endpoint Security Audit**	Evaluates BYOD and corporate device security — EDR coverage, patch management, disk encryption, local admin restrictions, peripheral controls, and compliance posture for devices connecting from home networks.
3	**Data Loss Prevention (DLP) Testing**	Assesses file transfer controls, cloud storage policies (OneDrive, Google Drive, Dropbox), email DLP rules, USB blocking effectiveness, screenshot/screen recording prevention, and data classification enforcement across remote endpoints.
4	**VPN and Network Security Testing**	Tests VPN configuration for split tunneling risks, DNS leak vulnerabilities, always-on enforcement, certificate validation, and connection failover behavior. Evaluates home network exposure through router security assessment.
5	**Remote Identity and Access Testing**	MFA bypass attempts on remote access portals, SSO security testing, session timeout and management validation, conditional access policy effectiveness, and privilege escalation from remote worker context.
6	**Collaboration Tool Security**	Assesses Microsoft Teams, Slack, Zoom, and Google Workspace — guest access controls, external sharing policies, meeting security settings, file sharing restrictions, and data retention configurations.
7	**Home Network Assessment**	Evaluates risks from the home network environment — router default credentials, firmware vulnerabilities, IoT device exposure, shared network risks, and network segmentation between work and personal devices.
8	**Remote Work Policy Review**	Reviews acceptable use policies, remote work security requirements, incident reporting procedures, physical security guidelines for home offices, and employee security awareness for remote work risks.

THE TECHNIEUM EDGE

Why Technieum for WFH Security

Our Methodology
VDI isolation testing followed by endpoint audit, DLP control validation, VPN/network assessment, identity testing, collaboration tool review, and home network evaluation — all mapped to remote work threat models.

Full Remote Stack Coverage
VDI + Endpoint + DLP + VPN + Identity + Collaboration + Home Network — comprehensive in one engagement.

Real Attack Simulation
We simulate data exfiltration, VPN bypass, and session hijacking as a real remote attacker would.

Multi-Platform Testing
Citrix, VMware, Azure Virtual Desktop, Teams, Slack, Zoom — we test your actual stack.

BYOD Risk Assessment
Evaluate risks from personal devices connecting to corporate resources — a blind spot for most vendors.

ToIP Intelligence
15,000+ real-world exploits including remote work and VPN-specific attack techniques.

Zero False Positives
Every finding validated for exploitability in your specific remote work environment.

Standards Alignment

Every Technieum engagement aligns with globally recognized security frameworks including OWASP Top 10, OWASP API Top 10, OWASP LLM Top 10, PTES, NIST CSF, NIST AI RMF, MITRE ATT&CK, CIS Benchmarks, IEC 62443, and ISO 27001:2022. Our team holds OSCP, OSEP, CRTE, CRTP, eWPTX, eCPPT, and CEH certifications. Technieum is ISO 9001:2015 and ISO 27001:2022 certified.

OUR METHODOLOGY

How We Deliver Results

Technieum's WFH security methodology follows a structured five-phase approach designed specifically for remote work environments — evaluating every layer from VDI isolation to home network risks.

Discover	Analyze	Attack	Report	Remediate
Asset enumeration	ToIP intelligence	Manual exploitation	CVSS/CWE scoring	AI-powered fixes
Tech fingerprinting	Logic extraction	Business logic test	PoC evidence	Stack-specific code
OSINT gathering	Threat modelling	Chain validation	Exec summary	Config guidance
Scope validation	Risk prioritization	Privilege escalation	Test case docs	Retest validation
Port scanning	Attack planning	Lateral movement	Playbook docs	Closure sign-off
Service detection	Playbook generation	Data exfiltration	Risk heatmap	Knowledge transfer

Phase 1 — Discover

Remote work environment inventory — VDI platforms (Citrix, VMware, Azure Virtual Desktop), endpoint management systems, DLP tools, VPN configurations, identity providers, and collaboration tools. Employee device posture assessment.

Phase 2 — Analyze

Configuration review of VDI isolation controls, endpoint security policies, DLP rule effectiveness, VPN split tunnel settings, MFA enforcement policies, and collaboration tool sharing permissions. Risk assessment against remote work threat models.

Phase 3 — Attack

VDI session hijacking and clipboard exfiltration testing. Endpoint bypass attempts on personal devices. DLP evasion through cloud storage and personal email. VPN bypass and DNS leak testing. MFA fatigue attacks on remote access portals. Collaboration tool data leakage testing.

Phase 4 — Report

Remote work-specific technical reports with VDI security findings, endpoint compliance gaps, DLP effectiveness metrics, VPN configuration issues, and identity security weaknesses. Risk scored by data exposure and access impact.

Phase 5 — Remediate

Remote work-specific hardening guidance — VDI configuration templates, endpoint policy updates, DLP rule refinements, VPN policy corrections, MFA strengthening recommendations, and collaboration tool permission tightening. Retest validates all controls.

DELIVERABLES

What You Receive

Every engagement produces four comprehensive deliverables designed for different stakeholders — from technical teams requiring reproduction steps to executives needing business impact context.

Technical Report	Management Report	Threat Model Report	ToIP Playbook
CVSS-scored, CWE-mapped findings with proof-of-concept evidence and step-by-step reproduction instructions for every vulnerability discovered.	Executive-level risk summary with business impact analysis, prioritized recommendations, and strategic remediation roadmap for leadership.	Comprehensive threat landscape analysis with attack vectors mapped to MITRE ATT&CK framework specific to your environment.	Target-specific attack playbooks generated from 15,000+ real-world disclosed vulnerabilities via our RAG-powered intelligence engine.

- ✓ **Technical Report**
  Detailed findings with CVSS scoring, CWE mapping, proof-of-concept evidence, and step-by-step reproduction instructions.
- ✓ **Management Report**
  Executive-level risk summary with business impact analysis, prioritized recommendations, and strategic remediation roadmap.
- ✓ **Threat Model Report**
  Comprehensive threat landscape analysis specific to your environment, attack vectors, and adversary profiles mapped to MITRE ATT&CK.
- ✓ **ToIP Playbook Document**
  Target-specific attack playbooks generated from 15,000+ real-world disclosed vulnerabilities via our RAG-powered intelligence engine.

All deliverables are produced within the agreed timeline with milestone-driven tracking. Critical findings are escalated immediately via the OffSec Management Portal — you never wait for the final report to learn about urgent risks.

Ready to Secure Your Organization?

Partner with Technieum for AI-powered offensive security with zero false positives.
